

Projet de troisième année

2025-2026

Entreprise :

Amundi Asset Management is a leading European asset management company and one of the largest in the world. It provides a wide range of investment solutions, including equities, fixed income, multi-asset, and alternative investments, to institutional and retail clients globally. Amundi is known for its strong focus on sustainable and responsible investment, with a commitment to integrating ESG (Environmental, Social, and Governance) criteria across its investment processes. The company is headquartered in Paris and operates in over 30 countries.

Amundi Technology is a division of Amundi Asset Management that specializes in providing innovative technology solutions for asset management. It offers a comprehensive suite of tools and platforms designed to support the entire asset management value chain, from portfolio management and risk management to regulatory compliance and client reporting.

Amundi Technology's flagship product, ALTO* (Amundi Leading Technology & Operations), is a cloud-based platform that enables asset managers, wealth managers, and institutional investors to streamline their operations, enhance decision-making, and improve efficiency. The platform covers various functionalities, including portfolio management, order execution, risk and performance analysis, compliance monitoring, and client reporting.

Amundi Technology also focuses on leveraging big data, artificial intelligence, and machine learning to develop cutting-edge solutions that help clients navigate the increasingly complex and data-driven financial markets. The division emphasizes flexibility and customization, allowing clients to tailor the technology to their specific needs.

Thème : Agentic A.I.

Context:

As part of innovation in asset management, Amundi aims to integrate agentic artificial intelligence technologies to optimize portfolio construction. The goal is to develop a system of autonomous agents capable of analyzing market data, assessing risks, and providing personalized investment recommendations to enhance portfolio performance and enable dynamic client portfolio management.

Objectives:

- Develop a system of intelligent agents (Agentic AI) that generate investment recommendations based on quantitative and qualitative analysis.
- Build optimized portfolios by integrating these recommendations, considering risk constraints, diversification, and client objectives.
- Automate the process of updating and adjusting portfolios according to market changes and signals detected by the agents.
- Improve transparency and explainability of the agents' recommendations to build trust with portfolio managers and clients.
- Evaluate the performance of portfolios constructed by the agents against traditional benchmarks.

Expected Deliverables:

- Functional and technical specifications document for the Agentic AI system.
- Functional prototype of intelligent agents capable of generating investment recommendations.
- Portfolio construction module integrating the agents' recommendations.
- Performance analysis report of constructed portfolios (backtesting and live testing).
- Technical documentation and user guide for asset managers.
- Deployment plan and recommendations for integration into Amundi's existing processes.
